TEKO

PSYCHOLOGIST TERMS OF USE, CONSENT AND ACKNOWLEDGEMENT

Version 2.0 - October 2026

These Terms are intended for psychologists using Teko. They explain the platform’s functionality, data entered and generated, game metrics, AI services, security controls, privacy and the professional’s responsibilities.

Principles that guide Teko

- Children and adolescents first.
- Purposeful playfulness.
- Evidence before conclusions.
- Accuracy, traceability and privacy.
- Transparent interpretation and support for professional practice.

Teko remains in development and validation. Early studies focus on adolescents aged 12–14, while the platform has a broader intended scope as a tool supporting psychological care.

1. About Teko and the purpose of these Terms

Teko is a playful digital platform under development as part of the Startup Project at Fundação Escola de Comércio Álvares Penteado - FECAP, developed by Carlos Eduardo de Lima, Maria Victória Batista Oliveira, and Miguel Rodrigues Pereira Francisco.

The platform was designed to transform interactions with gamified digital tasks into objective behavioral data and information that supports professional interpretation. At its current stage, Teko prioritizes adolescents aged 12 to 14 and uses ADHD as its initial focus for research and validation.

These Terms establish the conditions applicable to the psychologist's use of Teko and transparently describe how data entered into or generated within the platform are used in the currently planned features.

Teko does not replace diagnosis, clinical assessment, professional judgment, psychological care, or any other procedures that may be necessary for an individual case. Its results must be understood as complementary information.

2. Acceptance and professional profile

By creating an account, selecting the option to accept these Terms, or using features that depend on them, the psychologist declares that they have read and understood the conditions described herein.

During professional registration, Teko may request name, email address, password, CRP registration number and, where applicable, the name of the clinic. The psychologist is responsible for providing accurate information, keeping their credentials confidential, and not sharing access with unauthorized persons.

Use of the platform implies professional responsibility for the information entered and for the interpretation of the results presented.

2.1 Professional acknowledgement and separate lawful bases

Acceptance of these Terms records the psychologist’s understanding of and agreement to Teko’s conditions of use. It does not, by itself, constitute the patient’s or legal guardian’s consent to every personal-data processing operation. Each purpose requires an appropriate lawful basis under Brazil’s Law No. 13,709/2018 (LGPD); health and other sensitive personal data require one of the specific grounds in Article 11. The parties acting as data-processing agents must define and document their responsibilities, lawful bases and transparency information.

2.2 Evidence of acceptance

Where supported, the system should record the professional account, Terms version and language, date and time of acceptance, and any renewal. Merely using the platform must not be construed as specific consent for a purpose requiring a separate, prominent declaration.

3. Patient and responsible party registration

Under the current workflow, the psychologist may create a patient record by entering the patient's name, gender, and age. A responsible party is also linked to the patient, with name, email address, and telephone number recorded for contact purposes.

This information is organized in Teko's database so that each patient is correctly associated with their clinical information, game sessions, metrics, dashboards, and reports.

The psychologist must register only patients and responsible parties for whom they have appropriate professional authority and the authorizations applicable to care and use of the platform.

3.1 Data minimisation at registration

According to the local implementation report dated 11 October 2026, Teko no longer generates artificial e-mail addresses for patients; the patient e-mail field may remain empty. The CPF (Brazilian tax identification) field, which had no demonstrated operational purpose in the existing workflow, was reportedly removed. E-mail remains applicable to professional or guardian accounts where necessary for identification, authentication or contact. Only information compatible with specific, legitimate and disclosed purposes should be collected (LGPD, Article 6(I)-(III)).

4. Anamnesis, clinical notes, and appointments

After creating a patient record, the psychologist may record anamnesis information, clinical notes, and appointments. This content forms the clinical context recorded in Teko and remains linked to the patient.

The psychologist is responsible for the content they enter. Only information relevant to the purposes of care should be recorded, and excessive, irrelevant, or unnecessary third-party data should be avoided.

Anamnesis, clinical notes, and appointments are not used as inputs to the statistical model that calculates the ADHD-related estimate. This information is used later, when the psychologist requests the final report, to provide context for the textual synthesis.

4.1 Clinical narrative and indirect identification

Anamnesis and clinical notes may contain sensitive personal data and indirect identifiers, including names of relatives, institutions or distinctive circumstances entered in free-text fields. Psychologists should limit their records to what is relevant to care. Removing structured identity fields from a request to an external AI service does not necessarily remove identifying information embedded in clinical narratives.

5. Digital games and telemetry data collection

Teko currently uses three digital tasks: Jogo do Goleiro, Fotógrafo da Floresta, and Toca Rápido!. During each session, the system records behavioral events and telemetry data related to the patient's performance.

Depending on the task, these records may include response times, correct responses, omissions, commission errors, anticipations, stimulus events, trial-level responses, and performance-derived metrics.

The data remain associated with the patient and the corresponding session, allowing the session history to be preserved and the telemetry to be used in dashboard and statistical analysis features.

5.1 Main indicators and updated game timing

Teko’s core game-derived indicators are reaction-time variability in Jogo do Goleiro, the change in average reaction time between the first and second halves of Fotógrafo da Floresta, and the count of responses incorrectly made to cats in Toca Rápido!. Under the latest operating configuration reported by the team, Fotógrafo da Floresta lasts 12 minutes and compares the first six minutes with the last six. Administration details, calibration and interpretation limitations should correspond to the actual version used during each session; isolated metrics are not a diagnosis.

6. Dashboard and brief artificial intelligence interpretation

In the dashboard section, stored telemetry data are used to build interactive charts specific to each game, with the purpose of facilitating visualization of the patient's performance.

Under the current technical design, Teko sends a request to an external artificial intelligence API using an external language model configured for that purpose to generate a brief summary or interpretation that supports the reading of the charts.

The text generated by artificial intelligence may be stored with the dashboard information and may become part of the context later used to generate the final report.

This summary does not constitute a diagnosis, an independent clinical opinion, or a substitute for the psychologist's interpretation. The professional must critically review any automatically generated content.

6.1 Automated content and human review

AI-generated summaries are supporting text and may include inaccuracies. The psychologist must review them before clinical use. The system should transparently identify content produced by AI and, where available, retain the model, processing version and link to the relevant patient and session. External API processing is further addressed in Section 9.

7. Requesting the final report and operation of the analytical core

The final report is generated only when the psychologist requests this feature. Following this request, the system performs two separate stages that must not be confused: statistical analysis of telemetry data and, subsequently, integration of the context for report drafting.

7.1 Multiple linear regression model

The calibrated multiple linear regression model receives only telemetry data from the patient's most recent game session, according to the current technical configuration. Anamnesis information, clinical notes, appointments, and dashboard text are not inputs to this model.

The model output is a statistical estimate of the compatibility between the observed performance pattern and the profile used to calibrate the model. This estimate may be presented in percentage/probability format.

CENTRAL RULE: the statistical model uses only telemetry data from the games. Clinical context does not alter the regression calculation.

7.2 Context integration

After the statistical estimate has been calculated, Teko gathers the information required to prepare the final report. At this stage, the following may be combined:

- the estimate generated by the multiple linear regression model;
- metrics and information derived from telemetry data;
- the anamnesis recorded by the psychologist;
- the clinical notes entered into the system;
- appointments and the relevant history available;
- information and interpretations stored in the dashboard.

7.3 Final-report generation with AI

Under the current technical design, the integrated context is sent to an external artificial intelligence API using the external language model configured for that purpose, which organizes the information and drafts a version of the final report.

The document is then presented in a format consistent with Teko's identity for professional review. The psychologist must verify the content before using it in records, communications, clinical documentation, or decision-making.

7.4 Statistical estimate: limitations

The numerical output depends on the variables and calibration of the model employed; it is not automatically a clinically validated probability. Percentage-based presentation should be accompanied by appropriate limitations, the reference population and applicable validation evidence where available. Statistical calculation must not be confused with the subsequent drafting performed by a language model.

8. How data are used

Data processed by Teko are used according to the purpose of each feature:

Type of information	Source	Use within Teko
Professional account	Psychologist	Authentication, identity and account use.
Patient and guardian	Psychologist	Association of care and patient records.
Anamnesis, notes and appointments	Psychologist	Clinical context and inclusion in the final report on request.
Game telemetry	Digital sessions	Charts, metrics, history and statistical model inputs.
Dashboard summary	External AI API	Support for chart interpretation and final-report context.
Statistical estimate	Multiple linear regression	Supplementary quantitative information for the final report.
Final report	Combined context and external AI API	Drafting for professional review.

9. Use of external artificial intelligence services

Some Teko features depend on external technology services. Under the current design, API requests are made to generate dashboard summaries and the final report.

Information sent to these services must be limited to what is necessary for the purpose of each feature. Login data, passwords, and information that is not necessary to generate the content must not be used as context in artificial intelligence requests.

Because these are external services, technical processing is also subject to the policies, security measures, and terms of the provider used. Material changes in the manner of sharing or in the purpose of processing must be reflected in an updated version of these Terms or in the applicable privacy document.

9.1 Data minimisation before external processing

The local technical report dated 11 October 2026 states that, before sending a final-report drafting request to an external AI provider, structured fields identifying the patient, legal guardian, professional, professional registration and clinic are removed; identifying information is reintroduced locally when generating the PDF. Necessary clinical details, including age, game metrics, anamnesis and clinical notes, may still be transmitted. This amounts to data minimisation and partial de-identification, not proof of irreversible anonymisation under LGPD Articles 5(XI) and 12.

9.2 Vendors, international transfers and retention

External processing depends on the provider and the subscribed contractual configuration. Migration to the ChatGPT API (OpenAI) is planned and must not be represented as completed before implementation.

Before production operation, Teko should document the actual provider, data categories transmitted, any recipients and processing countries, applicable grounds and safeguards for international data transfers (LGPD, Article 33), retention, deletion, terms governing possible model training and the relevant contractual safeguards. Passwords and authentication secrets are not intentionally included in AI prompts.

9.3 Free-text review and provider changes

Indirect identifying information in free-text material calls for additional minimisation checks before external processing. Material changes to the provider, processing purpose or transmitted data categories must be reflected in privacy documentation and communicated to the professional; renewed acceptance may be required. Naming a provider does not amount to endorsing its privacy terms or certifying international transfers.

10. Storage, access, and security

Teko stores information necessary for the operation of its features, including registration data, clinical information, telemetry, metrics, dashboards, and reports.

The project adopts accuracy, traceability, and privacy as guiding principles. Access to data must be restricted to authorized users and persons according to their roles, and the necessary technical records must allow auditing and recalculation where applicable.

Final details regarding infrastructure, retention periods, deletion procedures, backups, and formal channels for exercising data rights will be defined as Teko evolves and reflected in the privacy policy and future versions of these Terms.

Current transparency: Teko is still in the development and validation phase. For this reason, these Terms describe the current functional workflow and do not present as final any legal structures, retention periods, or institutional responsibilities that have not yet been formally defined.

10.1 Legal framework for data protection

Processing must follow the LGPD principles of purpose limitation, adequacy, necessity, transparency, security, prevention and accountability (Article 6). Ordinary personal data require an appropriate ground under Article 7; health and other sensitive data require a ground under Article 11. Article 14 and ANPD Statement CD/ANPD No. 1/2023 require the child’s or adolescent’s best interests to prevail. These Terms do not presume that one lawful basis applies to all purposes or that professional acceptance replaces legally required authorisations.

10.2 Credentials, authentication and communications

The local architecture documentation reports salted password hashing using bcrypt with a cost factor of 10, signed JSON Web Tokens using the jose library, and HTTPS/TLS communications for the identified production integrations. Password hashing is not reversible encryption and does not by itself establish encryption at rest of clinical records in databases or backups. Actual TLS, at-rest encryption, key management and infrastructure configurations require environment-specific verification (LGPD, Article 46).

10.3 Separation of data by professional

The PostgreSQL database links patients, professionals and clinical records, and the documented local implementation includes Row-Level Security (RLS) policies that supplement application-layer authorisation. Exceptional administrative access must be limited to genuinely authorised support and governance functions. Effective tenant isolation depends on validating and applying the authenticated user and role

context correctly to database operations; connections without context must not be granted broad access by default.

10.4 Auditability and traceability

The technical report describes a dedicated audit-log table recording the user, role, action, resource type, identifier, necessary contextual details and timestamp. Reported events include patient creation, amendment and soft deletion, AI-report generation and PDF download. Read access is intended for authorised administrators. Asynchronous logging does not by itself prevent persistence failures, and a timestamp does not prove that all records are immutable. Permissions, integrity and monitoring require continued verification (LGPD, Articles 6(X), 37 and 46).

10.5 Retention, deletion and data-subject rights

Retention periods, backups, deletion requests and data-holding criteria must be specified by purpose and any applicable legal or professional obligations. Depending on statutory conditions, data subjects or their legal representatives may request information, confirmation of processing, access, correction, anonymisation or deletion where applicable, portability and sharing information under LGPD Articles 9 and 15–18. Requests may be directed to the contact identified in Section 15 and will be assessed by the competent processing agent.

10.6 Security incidents

Loss, unauthorised access or inappropriate disclosure must be assessed and documented. Where an incident may create relevant risk or damage to data subjects, the controller must make the applicable notifications to the ANPD and data subjects (LGPD, Article 48). ANPD Resolution CD/ANPD No. 15/2024 generally sets a three-business-day notification period, subject to specific legal deadlines and applicable regulatory exceptions.

10.7 Roles of processing agents

Whether an entity is a controller or processor depends on who actually determines the purposes and essential means of processing, rather than the name used in a contract. Teko, clinics and professionals should define their respective roles through suitable arrangements, including documented instructions, access, vendors and responsibilities. LGPD Article 37 requires processing records, Article 39 concerns processor instructions and Article 41 addresses the data-protection officer, subject to applicable rules and exceptions.

10.8 Limits of technical assurances

The measures described here are grounded in Teko’s local technical report of 11 October 2026. Their description is not an independent audit, a blanket certificate of compliance or proof of deployment in the production environment. The European Union General Data Protection Regulation (GDPR) applies only where its territorial and material scope is satisfied; compliance with it is not certified by these Terms.

11. Limitations of interpretation

- Teko does not perform autonomous diagnosis.
- The statistical estimate does not, by itself, confirm or rule out ADHD.
- Charts, metrics, probabilities, and AI-generated text are supporting information.
- Automatically generated content may contain inaccuracies, omissions, or simplifications.
- The psychologist remains responsible for professional analysis, report review, and decisions related to the patient.
- Teko must not be used as the sole source for significant clinical, educational, legal, or social decisions.

12. Psychologist responsibilities

By using Teko, the psychologist agrees to:

- provide truthful professional information and keep the account secure;
- register patients and responsible parties only when they have appropriate authority and authorizations;
- record clinical information in a relevant, necessary manner consistent with their professional practice;
- not share credentials or allow unauthorized access to the account;
- review charts, metrics, interpretations, and reports before using them professionally;
- not present Teko results as an automatic diagnosis or clinical certainty;
- comply with the professional, ethical, institutional, and legal rules applicable to their practice.

13. Data relating to children and adolescents

Teko was designed for children and adolescents and, in its current validation phase, prioritizes adolescents aged 12 to 14. For this reason, the processing of patient information requires enhanced attention to privacy, data necessity, security, and the best interests of the adolescent.

These Terms govern the psychologist's use of the platform. They do not replace the specific document intended for the patient's legal guardian, any assent that may be required from the adolescent, or any authorization required for research, school settings, clinics, or institutional protocols.

13.1 Best interests, legal grounds and safeguards

Under ANPD Statement CD/ANPD No. 1/2023, processing personal data of children and adolescents may rely on the legal grounds set out in LGPD Articles 7 or 11 provided their best interests prevail (Article 14). Where consent is selected as the lawful basis for processing a child’s data, applicable specific requirements, including Article 14(1), must be met. Professional acceptance is separate from any documentation owed to patients and guardians. Children must not be required to provide information beyond what is strictly necessary to participate in a game (Article 14(4)).

13.2 Professional limits and psychological assessment

Brazilian Federal Council of Psychology Resolution CFP No. 31/2022 regulates psychological assessment and the SATEPSI system. Teko’s game-based tasks and indicators are proprietary supplementary digital tools and are not represented as equivalent to or approved as standardised psychological tests. Their use must observe the evidence available, ethical duties and independent professional judgement.

14. Changes to the platform and these Terms

Teko may evolve its features, games, metrics, statistical models, technology providers, and artificial intelligence resources throughout development and validation.

When a change materially affects the data processed, the purpose of use, the manner of sharing, or the interpretation provided to the user, these Terms must be updated and the psychologist may be asked to provide renewed acceptance.

14.1 Document version control

Version 2.0 incorporates practices described in the local technical report of 11 October 2026 and distinguishes planned AI integrations from locally reported implementations. Material changes to purposes, providers, categories of data, retention or safeguards require coordinated updates to these Terms and the Privacy Policy. Where new processing requires consent or renewed acknowledgement, this must be specific and demonstrable.

15. Contact

While Teko's definitive institutional structure is still being formalized, questions regarding use of the platform, privacy, or data-related requests should be directed to the project's official contact channel:

Teko contact email: teko.controller@gmail.com

The address above is Teko's official contact channel for questions, support requests, and matters related to use of the platform and the data processed.

16. Acknowledgement and acceptance statements

For use within the application, the psychologist should actively accept the statements below:

☐ I have read and accept Teko's Psychologist Terms of Use, Consent and Acknowledgement.

☐ I declare that I will register patients and responsible parties only when I have the appropriate authority and applicable authorizations.

☐ I understand that the games generate and store telemetry data associated with the patient and the sessions performed.

☐ I understand that telemetry data are used to build the dashboards and, when the final report is requested, as input to the calibrated multiple linear regression model.

☐ I understand that anamnesis, clinical notes, and appointments are not inputs to the regression model and are combined with the statistical result only during preparation of the final report.

☐ I understand that Teko uses external artificial intelligence APIs to generate dashboard summaries and draft the final report.

☐ I understand that metrics, probabilities, insights, and reports are supporting resources and do not replace diagnosis or professional judgment.

☐ I agree to review generated content before using it in my professional practice.

☐ I understand that structured direct identifiers are removed before certain external AI calls, without any guarantee that clinical free text is completely anonymous.

☐ I understand that sensitive data and children’s and adolescents’ data require an appropriate lawful basis, security controls and protection of the child’s best interests; my professional acceptance does not replace patient rights.

☐ I have been informed about authentication, isolation of records by professional and traceability features described for the local implementation.

☐ I understand that AI providers and integrations may change and that migration to the ChatGPT API is planned; actual deployment must be communicated as required.

☐ I am aware of the official contact channel in Section 15 for privacy questions and data-subject requests, subject to assessment by the competent processing agent.

By accepting these options and continuing, the psychologist acknowledges the Terms and the platform’s limitations. This acceptance does not waive separate duties of privacy, security and transparency owed to patients.

LEGAL AND TRANSPARENCY REFERENCES

The official materials below support the legal distinctions in these Terms; listing them does not, by itself, prove full legal compliance.
